

ETHICS & OPEN SCIENCE

PMAP 8521: Program Evaluation for Public Service

December 9, 2019

*Fill out your reading report
on iCollege!*

PLAN FOR TODAY

Ethics of data analytics

Ethics of stories

Reproducibility and open science

Curiosity and learning more

COURSE OBJECTIVES

BY THE END OF THIS COURSE, you (1) will be literate in the language of causal inference, (2) will communicate evaluation outcomes clearly, and (3) will understand the ethics and limits of data analysis by designing, critiquing, coding, and running rigorous, valid, and feasible evaluations of public sector programs focused on society's most pressing problems.

Specifically, you'll be able to:

- Explain the philosophy of causation

- Identify and diagram program logic models

- Outline theories of change with directed acyclic graphs (DAGs)

- Summarize key threats to causal inference, identify these threats in evaluations, and mitigate these threats with research design

- Develop rigorous and valid statistical measures

- Run statistical models

- Explain the theory, research design, methods, and results of evaluations to all types of stakeholders, from highly trained econometricians to the general public

- Share your analyses and data with the public

- Identify ethical issues and limits in data science and program evaluation

- Become curious and confident in consuming and producing evaluations

MAIN TAKEAWAY

**Don't be afraid of
causal language**

The C-Word: Scientific Euphemisms Do Not Improve Causal Inference From Observational Data

Causal inference is a core task of science. However, authors and editors often refrain from explicitly acknowledging the causal goal of research projects; they refer to causal effect estimates as associational estimates.

This commentary argues that using the term “causal” is necessary to improve the quality of observational research.

Specifically, being explicit about the causal objective of a study reduces ambiguity in the scientific question, errors in the

Miguel A. Hernán, MD, DrPH

See also Galea and Vaughan, p. 602; Begg and March, p. 620; Ahern, p. 621; Chiolero, p. 622; Glymour and Hamad, p. 623; Jones and Schooling, p. 624; and Hernán, p. 625.

You know the story:

Dear author: Your observational study cannot prove causation. Please replace all references to causal effects by references to associations.

Many journal editors request authors to avoid causal language,¹ and many observational researchers, trained in a scientific environment that frowns upon

Confusion then ensues at the most basic levels of the scientific process and, inevitably, errors are made.

We need to stop treating “causal” as a dirty word that respectable investigators do not say in public or put in print. It is true that observational studies cannot definitely prove causation, but this statement misses

glass of red wine per day versus no alcohol drinking. For simplicity, disregard measurement error and random variability—that is, suppose the 0.8 comes from a very large population so that the 95% confidence interval around it is tiny.

The risk ratio of 0.8 is a measure of the association between wine intake and heart disease.

Instagram's feed ranking criteria

Instagram relies on machine learning based on your past behavior to create a unique feed for everyone. Even if you follow the exact same accounts as someone else, you'll get a personalized feed based on how you interact with those accounts.

Three main factors determine what you see in your Instagram feed:

1. **Interest:** How much Instagram predicts you'll care about a post, with higher ranking for what matters to you, determined by past behavior on similar content and potentially machine vision analyzing the actual content of the post.
2. **Recency:** How recently the post was shared, with prioritization for timely posts over weeks-old ones.
3. **Relationship:** How close you are to the person who shared it, with higher ranking for people you've interacted with a lot in the past on Instagram, such as by commenting on their posts or being tagged together in photos.

How Target Figured Out A Teen Girl Was Pregnant Before Her Father Did

Kashmir Hill Forbes Staff
Welcome to The Not-So Private Par

“ As Pole’s computers crawled through the data, he was able to identify about 25 products that, when analyzed together, allowed him to assign each shopper a “pregnancy prediction” score. More important, he could also estimate her due date to within a small window, so Target could send coupons timed to very specific stages of her pregnancy.

One Target employee I spoke to provided a hypothetical example. Take a fictional Target shopper named Jenny Ward, who is 23, lives in Atlanta and in March bought cocoa-butter lotion, a purse large enough to double as a diaper bag, zinc and magnesium supplements and a bright blue rug. There’s, say, an 87 percent chance that she’s pregnant and that her delivery date is sometime in late August.

At issue is the fact that I've used Predictim to scan a handful of people I very much trust with my own son. Our actual babysitter, Kianah Stover, returned a ranking of "Moderate Risk" (3 out of 5) for "Disrespectfulness" for what appear to me to be innocuous Twitter jokes. She returned a worse ranking than a friend I also tested who routinely spews vulgarities, in fact. She's black, and he's white.

I tell them I am sure that they don't have a 'Do Racism' button on their program's dashboard, but wonder if systemic bias could nonetheless have entered into their datasets. Parsa says, "I absolutely agree that it's not perfect, it could be biased, it could flag things that are not really supposed to be flagged, and that's why we added the human review." But the human review let these results stand.

Kianah Jay

Scan completed on: November 27, 2018

Report Summary

Initiate A New Scan

Bullying / Harassment:	Low Risk	+
Disrespectful Attitude:	Moderate Risk	+

After an audit of the algorithm, the resume screening company found that the algorithm found two factors to be most indicative of job performance: their name was Jared, and whether they played high school lacrosse. Girouard's client did not use the tool.

Algorithms sold to courts across the United States have been crunching those numbers since 2000. And they did so without much oversight or criticism, until *ProPublica* released an investigation showing the bias of one particular system against black defendants. The algorithm, called COMPAS, could single out those who would go on to reoffend with roughly the same accuracy for each race. But it guessed wrong about twice as often for black people. COMPAS mislabeled a person who *didn't* go on to reoffend as “high risk” almost twice as often for those individuals. And COMPAS also mistakenly assigned a higher number of “low risk” labels to white convicts who went on to commit more crimes. So the system essentially demonizes black offenders while simultaneously giving white criminals the benefit of the doubt.

Accidental(?) evil

Inadvertent Algorithmic Cruelty

Published 4 years, 11 months ago

I didn't go looking for grief this afternoon, but it found me anyway, and I have designers and programmers to thank for it. In this case, the designers and programmers are somewhere at Facebook.

I know they're probably pretty proud of the work that went into the "Year in Review" app they designed and developed, and deservedly so—a lot of people have used it to share the highlights of their years. Knowing what kind of year I'd had, though, I avoided making one of my own. I kept seeing them pop up in my feed, created by others, almost all of them with the default caption, "It's been a great year! Thanks for being a part of it." Which was, by itself, jarring enough, the idea that any year I was part of could be described as great.

Still, they were easy enough to pass over, and I did. Until today, when I got this in my feed, exhorting me to create one of my own. "Eric, here's what your year looked like!"

The Role of Deliberate Practice in the Acquisition of Expert Performance

K. Anders Ericsson, Ralf Th. Krampe, and Clemens Tesch-Römer

The theoretical framework presented in this article explains expert performance as the end result of individuals' prolonged efforts to improve performance while negotiating motivational and external constraints. In most domains of expertise, individuals begin in their childhood a regimen of effortful activities (deliberate practice) designed to optimize improvement. Individual differences, even among elite performers, are closely related to assessed amounts of deliberate practice. Many characteristics once believed to reflect innate talent are actually the result of intense practice extended for a minimum of 10 years. Analysis of expert performance provides unique evidence on the potential and limits of extreme environmental adaptation and learning.

Training history, deliberate practise and elite sports performance: an analysis in response to Tucker and Collins review—what makes champions?

K Anders Ericsson

bodies of knowledge for a more complete understanding of the complex development of elite performance.¹ In their recent article, Tucker and Collins² criticised a popularised but simplistic view of our work circulated on the internet, which suggests that anyone who has accumulated sufficient number of hours of practise in a given domain will automatically become an expert and a champion. Unfortunately they incorrectly attributed this view to me and my colleagues and criticised our research on deliberate practise.

“[A] popularized but simplistic view of our work, which suggests that anyone who has accumulated sufficient number of hours of practice in a given domain will automatically become an expert and a champion.”

Deliberate Practice and Performance in Music, Games, Sports, Education, and Professions: A Meta-Analysis

**Brooke N. Macnamara¹, David Z. Hambrick², and
Frederick L. Oswald³**

¹Princeton University; ²Michigan State University; and ³Rice University

Abstract

More than 20 years ago, researchers proposed that individual differences in performance in such domains as music, sports, and games largely reflect individual differences in amount of *deliberate practice*, which was defined as engagement in structured activities created specifically to improve performance in a domain. This view is a frequent topic of popular-science writing—but is it supported by empirical evidence? To answer this question, we conducted a meta-analysis covering all major domains in which deliberate practice has been investigated. We found that deliberate practice explained 26% of the variance in performance for games, 21% for music, 18% for sports, 4% for education, and less than 1% for professions. We conclude that deliberate practice is important, but not as important as has been argued.

Gender Balance Assessment Tool (GBAT)

Women are cited less often than men, and are also underrepresented in syllabi. Yet even well-meaning scholars may find that they have difficulty assessing how gender-balanced their bibliographies and syllabi really are. Counting is tedious and prone to human error, and scholars may not know the gender identities of all the authors. GBAT helps with that, by automating the process of evaluating each author's name and then providing an estimate of what percentage of the readings are by women.

Your assigned readings are approximately

47.43

percent woman-authored.

Race breakdown (probabilistic)

P - HACKING

Hack Your Way To Scientific Glory

You're a social scientist with a hunch: **The U.S. economy is affected by whether Republicans or Democrats are in office.** Try to show that a connection exists, using real data going back to 1948. For your results to be publishable in an academic journal, you'll need to prove that they are "statistically significant" by achieving a low enough p-value.

1 CHOOSE A POLITICAL PARTY

Republicans

Democrats

2 DEFINE TERMS

Which politicians do you want to include?

☒ Presidents

☒ Governors

☒ Senators

☐ Representatives

How do you want to measure economic performance?

☒ Employment

☐ Inflation

☒ GDP

☐ Stock prices

Other options

☐ Factor in power
Weight more powerful positions more heavily

☒ Exclude recessions
Don't include economic recessions

3 IS THERE A RELATIONSHIP?

Given how you've defined your terms, does the economy do better, worse or about the same when more Republicans are in office? Each dot below represents one month of data.

4 IS YOUR RESULT SIGNIFICANT?

If there were no connection between the economy and politics, what is the probability that you'd get results at least as strong as yours? That probability is your p-value, and by convention, you need a **p-value of 0.05 or less** to get published.

Result: Publishable

You achieved a p-value of **less than 0.01** and showed that **Republicans** have a **negative** effect on the economy. Get ready to be published!

If you're interested in reading real (and more rigorous) studies on the connection between politics and the economy, see the work of Larry Bartels and Alan Blinder and Mark Watson.

Data from The @unitedstates Project, National Governors Association, Bureau of Labor Statistics, Federal Reserve Bank of St. Louis and Yahoo Finance.

AUSTERITY AND EXCEL

Growth in a Time of Debt
Carmen M. Reinhart and Kenneth S. Rogoff
NBER Working Paper No. 15639
January 2010, Revised January 2010
JEL No. E2,E3,E6,F3,F4,N10

ABSTRACT

We study economic growth and inflation at different levels of government and external debt. Our analysis is based on new data on forty-four countries spanning about two hundred years. The dataset incorporates over 3,700 annual observations covering a wide range of political systems, institutions, exchange rate arrangements, and historic circumstances. Our main findings are: First, the relationship between government debt and real GDP growth is weak for debt/GDP ratios below a threshold of 90 percent of GDP. Above 90 percent, median growth rates fall by one percent, and average growth falls considerably more. We find that the threshold for public debt is similar in advanced and emerging economies. Second, emerging markets face lower thresholds for external debt (public and private)—which is usually denominated in a foreign currency. When external debt reaches 60 percent of GDP, annual growth declines by about two percent; for higher levels, growth rates are roughly cut in half. Third, there is no apparent contemporaneous link between inflation and public debt levels for the advanced countries as a group (some countries, such as the United States, have experienced higher inflation when debt/GDP is high). The story is entirely different for emerging markets, where inflation rises sharply as debt increases.

Debt:GDP = 90%+ → -0.1% growth

AUSTERITY AND EXCEL

Finally, Ms. Reinhart and Mr. Rogoff allowed researchers at the University of Massachusetts to look at their original spreadsheet — and the mystery of the irreproducible results was solved. First, they omitted some data; second, they used unusual and highly questionable statistical procedures; and finally, yes, they made an Excel coding error. Correct these oddities and errors, and you get what other researchers have found: some correlation between high debt and slow growth, with no indication of which is causing which, but no sign at all of that 90 percent “threshold.”

AUSTERITY AND EXCEL

Table 1. Real GDP Growth as the Level of Government Debt Varies:
Selected Advanced Economies, 1790-2009
(annual percent change)

Country	Period	Central (Federal) government debt/ GDP			
		Below 30 percent	30 to 60 percent	60 to 90 percent	90 percent and above

Ensure code is reproducible

R Markdown!

Use open formats

Use .csv, not .xlsx

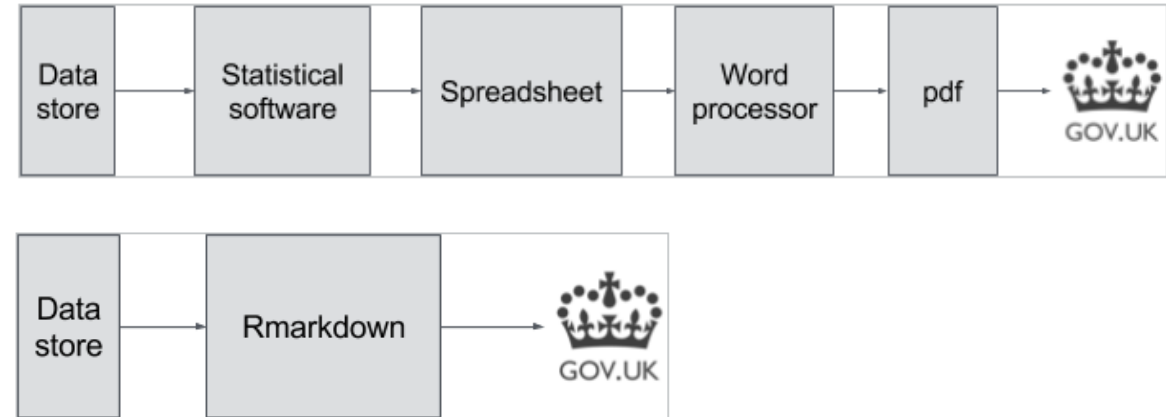

R MARKDOWN IN REAL LIFE

3.1.2 Data Visualization

We use `ggplot2` as our main package to create ad-hoc exploratory graphics as well as polished-looking customized visualizations. When combined with tools to clean and transform data, `ggplot2` allows analysts to quickly translate insights into high quality, compelling visualizations. In addition to the static graphics of `ggplot2`, we often make interactive visualizations or dashboards using R packages such as `plotly` (Sievert et al. 2017), `leaflet` (Cheng et al. 2017), `dygraphs` (Vanderkam et al. 2017), `DiagrammeR` (Sveidqvist et al. 2017), and `shiny` (Chang et al. 2017).

3.1.3 Reproducible Research

At Airbnb, all R analyses are documented in `rmarkdown`, where code and visualizations are combined within a single written report. Posts are carefully reviewed by experts in the content area and techniques used, both in terms of methodologies and code style, before publishing and sharing with the business partners. The peer review process is

The academic job search finally comes to an end

I am *so beyond thrilled* to announce that I'll be joining the [Andrew Young School of Policy Studies](#) at [Georgia State University](#) in Fall 2019 as an assistant professor in the [Department of Public Management and Policy](#). I'll be teaching classes in statistics/data science, economics, and nonprofit management in beautiful downtown Atlanta, and we'll be moving back to the South. I am so so excited about this! The Andrew Young School does amazing work in public policy, administration, and nonprofit management, and I'll be working with phenomenal colleagues and students. I still can't believe this is real.

Part of the reason I'm in shock is that for the past 2.5 years, I've been ripped apart and destroyed by the academic job market. This job market is a horrendous beast of a thing. It is soul-crushing and dream-shattering and a constant stream of rejection. While facing rejection [is good and builds grit etc., etc.](#), in reality it's awful.

In an effort to stay On Brand™, here are a bunch of fancy graphs and numbers showing what it's been like to apply for nearly 200 jobs since August 2016. Unlike many of my other blog posts, I haven't included any of the code to generate these. [That code](#) is all available in a [GitHub repository](#) (see `README.Rmd`), along with the [raw data](#) that I've collected over the past few years (for the morbidly curious).

Application count and outcomes

Between August 31, 2016 and November 18, 2018, I applied for 186 tenure-track and non-tenure-track academic jobs at R1 schools, liberal arts colleges, and teaching-focused public universities. I was offered one two-year visiting assistant professorship at the [Romney](#)
